Slides available for download from:

https://github.com/ResearchComputing/CMU HPC 2019

Outline for this presentation

- Logging into Summit (so we can practice Linux)
- Basic Linux commands
- File editing
- Linux filesystem
- Environment variables
- Software modules on RMACC Summit
- Other Linux topics (environment variables, modes, wildcards)

RC Access: Logging in

- If you have an RMACC account already, login as follows from a terminal:
 - \$ ssh janedoe@login.xsede.org ["janedoe"= your xsede username]
 - [enter xsede passcode and accept duo push or call to phone]
 - [janedoe@ssohub ~]\$ gsissh rmacc-summit
- If you do not have an RMACC account use one of our temporary accounts:
 - \$ ssh userNNNN@tlogin1.rc.colorado.edu
 - [enter temporary password provided by me]

Working on RC Resources

• When you first log in, you will be on a login node. Your prompt will look like this (e.g.):

```
[user0049@tlogin1 ~]$
```

• The login nodes are lightweight virtual machines primarily intended to serve as 'gateways' to RC resources. If you plan to work on Summit (most will), your first step should always be to move to a Summit 'scompile node':

```
[user0049@tlogin1 ~]$ ssh scompile
```

Now go to your working directory and download the material for this workshop:

```
[user0049@shas0137 ~] $ cd /scratch/summit/$USER [user0049@shas0137 ~] $ git clone https://github.com/ResearchComputing/CMU_HPC_2019
```

Linux

- Part of the Unix-like family of operating systems.
- Started in early '90s
- Several distributions are available from enterprise-grade, like RedHat Linux (RHEL), to more consumer-focused, like Ubuntu.
 - Summit nodes presently run RHEL7
- Runs on everything from embedded systems to supercomputers.
- Linux is simple, flexible, fast, many potent tools

Anatomy of a Linux command

- command [flags] [flag arguments] [target(s)]
 - Is -I myworkdir/
- Case is important!
- Help on commands is available through the "man" command (short for manual). E.g.,
 - man Is

File and directory related commands

- **pwd** prints full path to current directory
- cd changes directory; can use full or relative path as target
- mkdir creates a subdirectory in the current directory
- rmdir removes an empty directory
- rm removes a file (rm –r removes a directory and all of its contents)
- cp copies a file
- mv moves (or renames) a file or directory
- Is lists the contents of a directory (ls –l gives detailed listing)
- chmod/chown change permissions or ownership
- df displays filesystems and their sizes
- du shows disk usage (du skh shows size of a directory and all of its contents in KB and human readable)

Process and Program related commands

- ps lists processes (ps –ef lists all running processes)
- top shows processes currently using the CPU
- kill sends a signal to a process (kills process by default). Target is Process-ID; found in 2^{nd} column of ps –ef output.
- time shows how much wall time and CPU time a process has used
- free memory usage

File-viewing commands

- more displays a file one screen at a time
- cat prints entire file to the screen
- head prints the first few lines of a file
- tail prints the last few lines of a file (with -f shows in real time the end of a file that may be changing)
- diff shows differences between two files
- grep prints lines containing a string or other regular expression (ps –ef | grep XX)
- sort sorts lines in a file
- find searches for files that meet specified criteria
- wc count words, lines, or characters in a file

File editing with nano

- To edit a file:
 - nano myfile.txt
- From within Nano:
 - Ctrl+o save (need to confirm filename)
 - Ctrl+x exit
 - Ctrl+k cut
 - Ctrl+u paste
- Other population Linux editors: vi, emacs

The Linux Filesystem

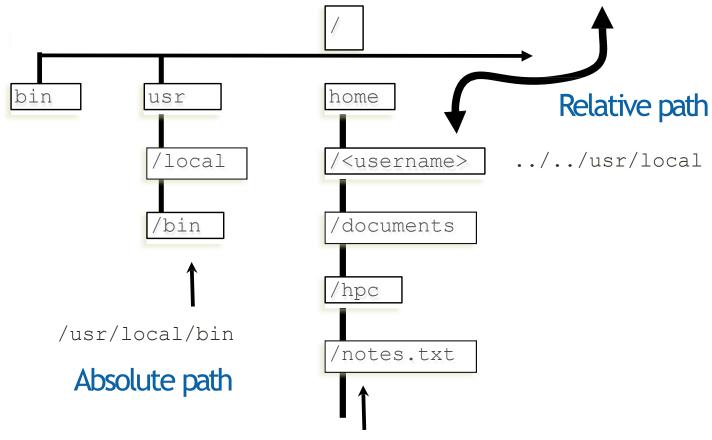

- System of arranging files on disk
- Consists of directories (folders) that can contain files or other directories
- Levels in full paths separated by forward slashes, e.g.
- /home/user/scripts/analyze_data.sh
- Case-sensitive; spaces in names discouraged
- Some shorthand:
 - . (the current directory)
 - .. (the directory one level above)
 - ~ (home directory)

Filesystem

Multiple Users

/home/<username>/documents/hpc/notes.txt

Your personal directories on Summit

- /home/<username>
 - Very small: 2GB.
 - Backed up daily.
 - Good for 'can't lose' files
- /projects/<username>
 - 250 GB
 - Backed up regularly
 - Good for storing scripts, self-installed software, some data
- /scratch/summit/<username>
 - Large: 10 TB partition
 - Fast filesystem -- Good for jobs with lots of I/O run your jobs on here!
 - Not backed up
 - Temporary: data deleted 90 days from creation.

Environment variables

- Environment variables store important information needed by Linux users, programs, etc.
- Type 'env' to see your currently set environment variables
- Useful Environment variables:
 - PATH: directories to search for commands
 - HOME: home directory
 - PWD: current working directory
 - USER: username
 - LD_LIBRARY_PATH: directories to search for shared objects (dynamically-loaded libs)

Software

- Common software is available to everyone on the systems
- Research Computing uses modules to manage software
 - You load modules to prepare your environment for using software
 - Modules set any environment variables, paths, etc.
 - Set environment so application can find appropriate libraries, etc.
- You can also install your own software
 - It is best if you are responsible for support
 - We are happy to assist

Using Modules

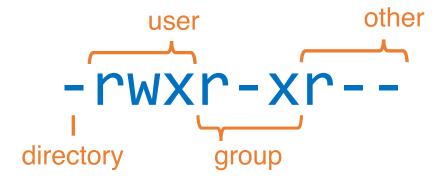

- You need to be on an scompile node to browse the modules
- To set up your environment to use a software package, type module load <package>/<version>
- Some modules might require a specific hierarchy to load
 - For some modules, you may need to specify a specific version
 - For example, module load R/3.3.0
 - For other modules, you may be able to be more generic
 - For example, module load matlab
- Some modules may require you to first load other modules that they depend on
- To find dependencies for a module, type module spider <package>
- To find out what software is available, you can type module avail

Modes (aka permissions)

- View file/directory permissions: "Is -I"
- 3 classes of users:
 - User (u), aka "owner"
 - Group (g)
 - Other (o)
- 3 types of permissions:
 - Read (r)
 - Write (w)
 - Execute (x)

Modes (continued)

• chmod changes modes:

• To add write and execute permission for your group:

chmod g+wx filename

To remove execute permission for others:

chmod o-x filename

Shell Wildcards and Special Characters

- * matches zero or more characters
- ? matches a single character
- # comment; rest of the line is ignored
- \ escape; don't interpret the next character
